Shapes

Edges in Images

What is it?

Edges

Edge detection is the process of finding boundaries of objects in an image

Edges = Points where brightness of pixel intensities changes **drastically**

Edge or No edge

Types of Edge Detection Algorithms

Types

- Laplacian
- Sobel
- Canny

Laplacian

Laplacian edge detection computes gradients

Laplacian(image, CV_64F)

Sobel

Sobel edge detection computes gradient magnitude representations along the x and y axis and then combines both the vertical edges and horizontal edges

Sobel(image, CV_64F, order of derivatives)

Canny

Canny edge detection is a multi-step process

- Blur the image to remove noise
- Compute Sobel gradient images in the x and y direction
- Suppress edges
- Hysteresis thresholding stage that determines if a pixel is "edge-like" or not

Canny(image, non-edge_threshold, edge_threshold)

Contours

What is it?

Contours

A contour is a curve of points, with no gaps in the curve

To find contours in an image:

- Edge detection
- Thresholding

findContours()

findContours()

- image
- Types of contour
 - cv2.RETR_EXTERNAL
 - cv2.RETR_LIST
 - cv2.RETR_COMP
 - cv2.RETR_TREE
- approximation of contour
 - cv2.CHAIN_APPROX_SIMPLE
 - cv2.CHAIN_APPROX_NONE
- Returns a tuple
 - output image after applying contour detection
 - cnts list of contours detected
 - hierarchy of the contours

Watershed

What is it?

Watershed

Classic algorithm used for **segmentation** and is especially useful when extracting touching or **overlapping objects** in images

When utilizing the watershed algorithm we must start with **user-defined markers**

These markers can be either defined:

- manually point-and-click
- automatically or heuristically define them
 - thresholding operations
 - morphological operations

Segment & Extract Objects

Import the libraries

Load the image

Apply Pyramid Mean Shift Filtering

Convert the image into grayscale

Threshold the Mean Shifted image

Detect Contours using `findContours()`

Draw Contours using `drawContours()`

Display the extracted contours

Shapes

What is it?

Shape detection

Find **contours** of objects

Find **centers** of each object

Recognize **shapes** of each object

- Circle
- Square
- Rectangle
- Triangle
- Pentagon

Label color of a shape

Shape detection

- **Contour Approximation**
 - Algorithm for reducing the number of points in a curve with a reduced set of points
 - Assumption: A curve can be approximated by a series of **short line segments**
- **cv2.approxPolyDP()**
 - contour
 - 1-15% of contour perimeter
- **Shape analysis**
 - If vertices are 3 in the contour
 - Traingle
 - If vertices are 5 in the contour
 - Pentagon
 - If vertices are 4 in the contour
 - If aspect ratio is between 0.95 to 1.05
 - Square
 - If aspect ration is skewed
 - Rectangle
